

THE NEUTRAL PRICE LAYER FOR AI

Ask what it costs. Get evidence.

One MCP-first interface for agents to resolve, normalize, compare, and cite prices across products, flights, FX, and beyond.

LIVE MVP

MCP-FIRST

NO SPONSORED RANKING

PROBLEM

AI can find a price. It cannot reliably trust it.

The same product has different names, variants, sellers, and conditions.

Prices go stale. Shipping, membership, availability, and tax are often hidden.

Search rankings optimize ads and affiliates—not agent trust.

Agents need comparable evidence, not a plausible headline price.

INSIGHT

A price is not a number. It is an evidence object.

~~"\$199"~~

A number without identity, seller, source, timestamp, conditions, or confidence cannot safely drive an agent decision.

**Canonical item + normalized
quote + provenance**

PriceMCP keeps product or itinerary identity, provider trust, total, freshness, availability, conditions, match confidence, and source URL together.

This becomes a reusable contract for every AI surface.

PRODUCT

One query. One canonical entity. Many source-backed offers.

LIVE MCP INFRASTRUCTURE CONSOLE

Watch the price layer work.

This console uses an official MCP SDK client to invoke the same PriceMCP server exposed at /mcp. It shows the request, entity resolution, source fan-in, normalization, ranking, provenance, and structured response.

Run live 5-store product queryRun disclosed flight fixtureOpen tools/list JSON

LIVE SNAPSHOT · 5/5 offers retain source URLs

Truth boundary: Product evidence is the deployed live snapshot. The flight example is explicitly synthetic and non-bookable. If a live provider is not configured, PriceMCP fails closed instead of inventing a fare.

Pipeline trace

OFFER-LEVEL PROVENANCE

QODO-REVIEWED

HUMAN-GATED WRITES

Neutral data infrastructure between agents and commerce.

Moat compounds in normalization rules, entity graphs, provenance, and coverage.

Start where price ambiguity hurts. Expand through one interface.

NOW

Apple products

Finite catalog, exact variants, high purchase intent, recognizable merchants, and a demo judges understand instantly.

EXPAND 01

US retail

Onboard the 15–20 retailers that matter, not a long tail of weak sources.

EXPAND 02

Travel

Flights prove the same normalized quote contract across a different domain.

EXPAND 03

FX + markets

Add high-frequency price domains where source, timestamp, and spread are essential.

Distribution: agent frameworks, MCP directories, AI search, and enterprise copilots.

Agents need a price layer built for them—not adapted from ads.

Existing consumer destinations

- Google Shopping, marketplaces, travel aggregators
- Excellent destinations; rankings can include commercial incentives
- Human-facing pages, category silos, uneven machine provenance

PriceMCP

- + Agent-native MCP and structured APIs
- + Neutral ranking with source evidence preserved
- + One contract across products, travel, FX, and future categories
- + AI agents are becoming buyers and recommenders now

The opportunity is the trusted data plane beneath every AI shopping experience.

Usage-based infrastructure with enterprise trust.

Developer API

Free evaluation tier, then usage-based MCP/API calls.

Enterprise

Higher limits, SLAs, private source policies, audit exports, and support.

Data partnerships

Direct feeds and verified merchant inventory —without paid ranking.

NEXT

Coverage

15–20 major US retailers and stronger refresh automation.

THEN

Design partners

Agent builders and commerce copilots that need auditable price evidence.

LATER

Category scale

Live flights, FX, groceries, tickets, energy, and other price domains.

Business model and roadmap are hypotheses; the infrastructure MVP is working.

THE ASK

Help make price evidence a primitive for every AI.

We are looking for design partners, trusted data providers, and agent builders who want neutral, auditable price infrastructure.

Agent / copilot design partners

Retailer and travel data partnerships
